TITLE: Problems of the Construction and Exploitation of Mining Enterprises. Scientific-Technical Conference at the Institute of Mining, Academy of Sciences USSR (Voprosy stroitel'stva i ekspluatatsii gornykh predpriyatiy. Nauchno-tehnicheskoye soveshchaniye v Institute gornogo dela Akademii nauk SSSR)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Otdeleniye Tekhnicheskikh Nauk, 1958, Nr 3, p 173 (USSR)

ABSTRACT: On November 20-21, 1957, a conference took place on the problems of the construction and exploitation dealing with the mineral deposits under complicated hydrological and geological engineering conditions. The conference was organised by the Institute of Mining together with the Central Administration of the Scientific-Technical Society; 320 delegates, nearly all representatives of the appropriate large enterprises, were present. The conference was opened by Academician L. D. Shevyakov. At the plenary meeting of the conference the following papers were presented: A. T. Bobryshev on "Hydrological conditions of the Yakovlev deposits of the Belgorod iron ore district of the Kursk Magnetic Anomaly (KMA) and the corresponding scheme of the lowering of the water level and

draining undertakings"; M. I. Agushkov on "Methods of opening workings and the systems of exploitation of the rich iron ores of the Belgorod district of the Kursk Magnetic Anomaly"; G. N. Man'kovskiy on "The tasks of scientific research in the field of construction and exploitation of mining enterprises of soaked deposits"; I. V. Popov on "The task of engineering geology in connection with the appraisal of conditions of opening and exploitation workings of deposits"; S. A. Krivorog on "Methods of draining of heavily water-soaked coal deposits and ways of their perfection"; H. F. Unkovskaya and M. N. Gusarev on "Mining works under conditions of water-soaked karst"; D. I. Maliovanyi on "New equipment in shaft construction by special methods". Several papers were submitted in the conference sections: "On the introduction into practice of blasting timber technique in the Moscow Basin"; "On the experience of sinking main (entry) shafts under the complicated hydrological conditions of the Tula coal deposits"; "Exploitation of main shafts in the frozen quaternary coal deposits of Vorkuta"; "On the influence of soaking upon the development procedure of the polymetallic ores of Zyrankoye deposit";

size diameter shaft drilling, rock freezing, stopping of cracked rocks and lowering of the water level. Taking the complicated innate conditions of iron ore deposits of the Kursk Magnetic Anomaly into consideration, the conference stressed the purposefulness of the scientific-exploratory works of the Lebedinskiy open pit workings - now in reconstruction - to be carried through - to fix up stable angles of slopes (dip).

TITLE: An investigation by means of radioactive isotopes of the behavior of small calcium additions in the process of smelting nickel-chromium alloys

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 6, 1962, 29, abstract 6G219  
(In collection: "Metallurgiya i metalloved. chist. metallov".  
Moscow, Gosatomizdat, no. 3, 1961, 216 - 224)

TEXT: When investigating by means of radioactive isotopes ( $\text{Ca}^{45}$ ) under laboratory conditions the behavior of small Ca additions in the process of smelting Cr-Ni-alloys of XH80T (KhN80T) type it has been established that Ca spreads as a rule over the ingot irregularly. Keeping alloy in a molten state contributes to a more regular distribution of Ca. The latter can be present both in non-metallic inclusions and in a solid solution, whereby the Ca content in the solution decreases sharply with the increase of the time the metal is kept in a molten state. For example, in an alloy kept after reduction during 20 minutes the amount of non-metallic inclusions has decreased approximately 6 times and

Title : Modification of the Fermentation Activity of Seeds when Sounded with Ultrasound

Orig Pub : Izv. Insta biol. Bulg. Academy of Sciences, 1956, 7, 129-140

Abstract : Seeds of alfalfa, rice, wheat and barley, tobacco and other plants were subjected to the action of ultrasounds for a period of 1 to 30 minutes. Three to five days later in the germinating seeds determination was made of the activity of amylase (autolytic method), catalase (titrometric method with 0.1 n KMnO<sub>4</sub>), and peroxidase (Boyarkin method with the use of the Pul'frikh photometer).

Card 1/2

Germination activity (up to 150% in alfalfa) and growth processes. Under the influence of a powerful ultrasound the optimum of the duration of the sounding is lower.

TITLE: Oxidation of Propane-Oxygen Mixtures at Constant Temperature and Pressure From Aspects of Thermodynamics

PERIODICAL: Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 10, pp 2121-2127 (USSR)

ABSTRACT: In his work (Ref 1) Academician N. N. Semenov mentions the experimental results obtained by N. Ya. Chernyak and V. N. Shtern (Ref 2) on the course of reaction of a propane-oxygen mixture at 350 C and a pressure of about 282 mm Hg. Table 22 (Ref 1) contains the composition of the mixture for various stages of the reaction. Semenov indicates that energetic problems are neglected in the analysis of the results. Since the thermal effect is apparently the most effective factor determining the direction and rate of the reaction, it should not be ignored. The author investigated the dynamics of oxidation of propane by oxygen on the basis of the theory of irreversible processes which has been developed by the author in various publications (Refs 3 and 4). This investigation is based on the fact that the state of thermodynamic equilibrium in the closed isothermal-isobaric system is determined by the

TITLE:	: The More Important Types of Scraps in Enamel Practice and Methods for Their Elimination	
INFO. PUB.:	: Lekta Pramishlenost, 7, no 9, 19-81 (Lend)	
ABSTRACT:	: The author analyzes the causes for flaking, the formation of cracks, bubbles, pores, 'fish scales,' 'copperheads' (sic!), as well as of other less dangerous defects in enamel (E) coatings. To eliminate flaking of the E free cast iron ware, the author recommends an increase in the content of $\text{CO}_2\text{O}_3$ in the base coat to 0.5% (in order to improve adhesion to the metal) or the addition to the E of 1% $\text{Na}_2\text{CO}_3$ during grinding (to increase the coefficient of expansion) or $\text{Na}_2\text{SiO}_3$ .

Title : Particle Size of Enamels as a Function of Quality of  
Enamored Products

Orig Pub : Loka promishlenost, 1957, 6, No 12, 18-20

Abstract : General information regarding particle size of powdered enamels are presented, operation of ball mills is briefly described, and formulas for the determination of rotation speed are given. The importance of complying with the specific grinding conditions that yield the desired quality of finished products is emphasized.

**Preparation of cements for teeth.** K. PUDRY. *Keram. i Steklo*, 6 [6], 200-2 (1930). Prepn. of dental cements in U. S. S. R. is described. Two kinds of cements are made: "phosphate" cement (the main ingredient is Zn) and the "silicate" cement (a kind of opal glass). The liquid for these cements is prep'd. from  $H_2PtCl_6$  and salts of Zn and Al. Tests with Russian cements showed that they are as good as those prep'd. abroad and much cheaper. M. V. KONTOVITY

APPROVED FOR RELEASE: Tuesday, August 01, 2000 CIA-RDP86-00513R0013423

Water-miscible emulsions of paints and lacquers. K.  
Popov. *Makhtobnaia Zhurna*, No. 15, No. 5, 28-30  
(1939).—Preliminary expts. in the prepn. and testing of  
oil-in-water paint pastes are discussed. The pastes were  
prep'd. from dehydrated castor oil (acid no. 22, I no.  
81.7, viscosity 10.2) and sardine oil boiled with 10%  
Mn-Ca drier to acid no. 13.7, I no. 92.0 and viscosity 1.2  
(ball viscometer). The best product was obtained with  
oil 33.41, lithopone 39.81, dry casein 3.31, phenol 0.06  
and 1.5% NH<sub>4</sub>OH 23.41%. The pastes, when dried, with  
water, can be brushed but not sprayed on wood or metal  
surface. The coating dries in 48 hrs. In the hardness,  
elasticity and resistance to water the resulting films are  
inferior to those formed by common oil paints.
